

Abstract of the Disclosure

A cleaning processing apparatus, which is one embodiment of a liquid processing apparatus for performing a liquid processing by supplying a predetermined process liquid to a target object to be processed such as a semiconductor wafer while rotating the target object, comprises a rotor for holding wafers W, a slidable process section for housing the rotor, and a cleaning liquid spurting nozzle for supplying a predetermined cleaning liquid to the wafers W. A housing for housing the slidable process section is of a hermetic structure so as to be substantially shielded from the outside.
